

How much detail does the comparison need?

Two raw-data columns → test preservation and compactness → select the smallest qualifying representation

01 RAW VALUES

Benign	Malignant
0.2699	1.0950
0.1852	0.5435
0.2773	0.7456
0.1839	0.4956
0.1563	0.7572
0.2636	0.3345

Six rows shown; all 569 values used.

02 SCREEN 15 CHART FAMILIES

Match chart purpose to the question.
7 eligible families → 21 display settings
Exclude 8 families for other tasks

Preserve the comparison: $E \leq \text{tolerance}$

Score = reduction in values (%)
Floor at 0; reject with 0*. Highest score first.

03 ONE DISPLAYED CHOICE

Histogram / 96.8

Here, a histogram is displayed: 18 of 569 values retained. A binned heatmap has equal numerical merit.

Primary audit: 61 mean, 29 five-number, 33 binned and 4 density selections across 127 comparisons.

The score describes eligible numerical simplification, not reader accuracy. Source: UCI WDBC / 10.24432/C5DW2B.
